Allergy Therapeutics is a UK based pharmaceutical company which provides products for the diagnosis and treatment of allergic conditions with a special focus on allergy vaccination (also known as specific immunotherapy). Allergy vaccination is a successful treatment that deals with the underlying cause of allergies and not just the symptoms.

Pollinex® Grasses + Rye and Pollinex® Trees are the only licensed subcutaneous Grass and Tree immunotherapy treatments available in the UK. Pollinex® Grasses is the only immunotherapy to contain an equal mixture of 13 different grasses.

Allergy Therapeutics has long been at the forefront of innovation in the specific allergy vaccination field. It was the first company to introduce the chemical modification of the allergen extract to produce allergoids. These are purified allergen extracts which have been chemically treated to reduce the IgE reactivity whilst maintaining their IgG inducing profile.

In order to reduce the number of injections required for subcutaneous immunotherapy, our formulations include combinations of allergens or allergoids with an MCT (Microcrystalline Tyrosine) depot and in some products the adjuvant MPL®.
